Low Height Module for Ventilation and Drainage of Outdoor Flooring

Roofingreen LEAF is the eco-friendly, lightweight, easy-to-handle module designed for renovation of roofs and terraces to enhance both the aesthetical and functional properties, in only 2.5 cm of thickness.

A technologically state-of-the-art product, it allows water drainage and micro-ventilation of the pavement. Thanks to its large contact area it distributes weight loads evenly, making the green surface stable and comfortable to walk on. Its design, compatible with the complete range of Roofingreen products, has been developed to protect the underlying waterproof layer for a long period of time, and allows for easy positioning of exterior electrical wiring.

Roofingreen LEAF is an innovative, dry system which redefines and adds value to the synthetic grass concept: durable, handy, light-weight and with a natural aspect, suitable for various applications.
